

C. Literature-supported gene links that emerge only under the real screen context

SCREEN	PAIR	INFLUENCE ON THE TARGET GENE		BIOLOGICAL RATIONALE
HT-29 colorectal CRISPRko • DMSO control reduced proliferation	DCAF1 → ZNF638	this screen	+6.14	DCAF1 ubiquitin-ligase substrate receptor  → both act on the HUSH complex ← ZNF638 recruits it to retroelements
Capan-1 pancreatic CRISPRko • Cpd-391, 50 nM increased drug sensitivity	IGHMBP2 → GCN1	this screen	+4.01	IGHMBP2 ATP-dependent RNA helicase  → both act on ribosomes ← GCN1 senses when they stall and collide
HCT 116 colorectal CRISPRko • SARS-CoV-2, 0.3 MOI increased ribosomal frameshifting	GTF3C1 → ACTR5	this screen	+3.80	GTF3C1 TFIIIC subunit, positions Pol III  → both act on tRNA genes ← ACTR5 subunit of the INO80 remodeller
